

## PROBLEM STATEMENT

## 04

# The Angaar Labs Website

Build the official website of our own web-dev studio. The UI is the entire challenge — make the visitor stop, stare, and want to hire us.

|            |                         |                |                         |
|------------|-------------------------|----------------|-------------------------|
| Domain     | Agency / Marketing site | Core challenge | World-class UI & motion |
| Difficulty | Intermediate (UI-heavy) | Stack          | React or Next.js        |
| Roles      | Visitor · Admin (CMS)   | Mode           | Team · Vibe coding      |

**IMPORTANT · Read this entire document before you write your first prompt**

Every section is part of the evaluation. Pages, APIs, data models and rules listed as **P0 (Must Have)** are mandatory. Your team will be asked to explain any part of the code during the viva — AI-generated code you cannot explain earns no marks.

# 1 Exam Instructions & Ground Rules

This is a **team-based, vibe-coding examination**. You are allowed — and expected — to use AI coding tools to build a **production-grade** application. The goal is not to type every line yourself; the goal is to **architect, direct, review, integrate and ship** a complete product, and to fully understand what you shipped.

## 1.1 What is allowed

- AI coding assistants: Cursor, Claude, ChatGPT, GitHub Copilot, Windsurf, v0, Bolt, Lovable, Gemini, etc.
- Official documentation, npm packages, UI component libraries (shadcn/ui, MUI, Chakra, Aceternity, Magic UI), icon packs and free stock media.
- Free-tier cloud services: MongoDB Atlas, Cloudinary, Vercel, Netlify, Render, Railway, Upstash Redis.
- Discussion **within** your own team.

## 1.2 What is NOT allowed

- Cloning a complete existing project / GitHub repo / paid template and submitting it as your own.
- Sharing code, prompts or repositories with other teams.
- Committing secrets (API keys, DB passwords, JWT secrets) to the repository.
- Submitting a UI-only mock where the backend, database or auth is faked (unless the PS explicitly allows a mock for that part, e.g. payment gateway in test mode).

## 1.3 Team working rules

- Create **one GitHub repository** per team at the start of the exam and add every member as a collaborator.
- **Every member must commit** from their own GitHub account. Commit history is checked to verify contribution.
- Commit early and often with meaningful messages (e.g. `feat(auth): add JWT refresh flow`), not `final`, `asdf` or one giant commit at the end.
- Use branches per feature (`feature/auth`, `feature/dashboard`) and merge via pull requests if time permits.
- Keep a running `PROMPTS.md` file in the repo where you paste the key prompts your team used. This is part of the evaluation.

## 1.4 What “production-grade” means in this exam

| Area           | Minimum expectation                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication | Signup, login, logout, protected routes, hashed passwords (bcrypt), JWT (access token; refresh token is a bonus), role-based access where roles exist. |
| Validation     | Every form validated on the client <b>and</b> every API body validated on the server (Zod / Joi / express-validator). Clear inline error messages.     |
| Error handling | Central Express error middleware, consistent JSON error shape, no raw stack traces in responses, toast/inline errors on the UI.                        |
| UI states      | Loading (skeletons/spinners), empty states, error states and success feedback on every data-driven screen.                                             |
| Responsiveness | Works on mobile (360px), tablet and desktop. No horizontal scroll.                                                                                     |

| Area            | Minimum expectation                                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Config          | All secrets in <code>.env</code> ; a complete <code>.env.example</code> committed; no hard-coded URLs.                                                 |
| Code quality    | Sensible folder structure, reusable components, no dead code dumps, consistent naming, ESLint/Prettier.                                                |
| Security basics | CORS configured, helmet, rate limiting on auth routes, input sanitisation, authorisation checks on every protected endpoint (not just hidden buttons). |
| Data            | Seed script with realistic demo data so the evaluator can test immediately.                                                                            |

#### RULE • Viva

Each member will be asked to explain parts of the codebase — an API route, a schema, a component, a design decision. If nobody in the team can explain a piece of code, that feature is treated as not implemented.

## 2 Problem Overview

The Angaar Labs is our own website-development studio. It builds websites and products for businesses across many industries — real estate, cafes & restaurants, clothing brands, healthcare, CRMs, e-commerce and more. The studio now needs its **own flagship website**, and it has to be exceptional: when a potential client lands on it, the craft of the site itself should convince them that this studio can build anything.

Your task is to design and build that website. This is a **UI-first** problem statement: the dominant evaluation criterion is **visual design and motion quality**. A technically correct but ordinary-looking site will score low. The site must be built in **React or Next.js**, be fully responsive, and have a working backend for the contact enquiry form and (ideally) a small CMS for projects.

#### IMPORTANT • Logo & brand assets

The Angaar Labs **logo will be provided** to whoever is building this. Additional details about the studio (services, past work, positioning) can be found by searching for “The Angaar Labs” online. Do not invent fake clients or testimonials presented as real — label sample content as sample.

#### NOTE • Theme direction

The brand feeling is “**angaari**” — **fiery, bold, high-energy, premium**. Think embers and heat: deep dark base, glowing orange/amber accents, strong display typography, confident motion. You decide the exact execution — originality is rewarded.

## 3 Objectives — What Is Being Tested

| Skill                          | How it shows up in this PS                                                                    |
|--------------------------------|-----------------------------------------------------------------------------------------------|
| Visual design                  | Layout, hierarchy, spacing, typography, colour, imagery — a cohesive, original, premium look. |
| Motion design                  | Scroll animations, hover states, page transitions, a memorable hero — smooth at 60 fps.       |
| Component architecture         | Reusable, well-structured React components; a small design system.                            |
| Responsiveness & accessibility | Flawless from 360px to desktop; keyboard & screen-reader friendly.                            |

| Skill                  | How it shows up in this PS                                                            |
|------------------------|---------------------------------------------------------------------------------------|
| Performance            | Fast load, optimised images, lazy loading, good Lighthouse scores.                    |
| Backend basics         | Working contact form with validation + storage + notification; optional projects CMS. |
| Content & storytelling | Communicating what the studio does and why to hire it.                                |

## 4 Information Architecture (Pages)

These pages/sections are required. You may combine some as sections of a long landing page plus separate routes, but all content must exist.

| Route       | Page       | Must contain                                                                                                                                                                                                                                             |
|-------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| /           | Home       | A show-stopping hero (brand statement + motion), what we do (services preview), industries we serve, 3–4 featured projects, why-us / stats, process preview, a strong testimonial, and a clear CTA to start a project. This page carries the wow-factor. |
| /about      | About      | Who the studio is, mission & values, capabilities, the team (cards with roles), culture. Keep it visual, not a wall of text.                                                                                                                             |
| /story      | Our Story  | The journey & vision of the studio — a narrative / timeline (founding, milestones, where it's headed). Great place for scroll storytelling.                                                                                                              |
| /work       | Our Work   | Portfolio grid filterable by industry (Real Estate, Cafe/Restaurant, Clothing, Healthcare, CRM, E-commerce, Other). Each card animates and links to a case study.                                                                                        |
| /work/:slug | Case study | One project in depth: hero image, client & industry, the problem, the solution, visuals/mockups, tech used, result, next-project link.                                                                                                                   |
| /services   | Services   | What the studio offers (Web design, Web development, E-commerce, CRM/dashboards, Branding, Maintenance). Each with a short description, deliverables and an icon/illustration.                                                                           |
| /contact    | Contact    | Working enquiry form (name, email, company, budget range, service needed, message), studio email/socials, map or location, fast and friendly.                                                                                                            |

### Global / shared

- Sticky responsive navbar with animated active states and a prominent “Start a project” button; mobile menu (full-screen overlay).
- Footer: quick links, services, socials, contact, newsletter signup, “made by The Angaar Labs”, back-to-top.
- Reusable building blocks: Button, SectionHeading, ProjectCard, ServiceCard, Marquee, StatCounter, TestimonialCard, Reveal wrapper.
- Loading screen / page-transition animation, smooth scroll, scroll progress, custom cursor (optional), 404 page on-brand.

## 5 Required Sections on the Home Page (detail)

| # | Section                  | Required behaviour & ideas                                                                                                                                                                                                                          |
|---|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | <b>Hero</b>              | Full-viewport. Big bold headline (e.g. "We build websites that sell"), subline, two CTAs. Signature motion: animated gradient/ember background, kinetic/ split-text headline reveal, or a 3D/canvas element. This is the single most judged screen. |
| 2 | <b>Trusted / marquee</b> | Infinite marquee of industries or client logos (sample) to establish credibility.                                                                                                                                                                   |
| 3 | <b>Services preview</b>  | 3-6 service cards with hover animation; link to /services.                                                                                                                                                                                          |
| 4 | <b>Industries</b>        | Grid of the industries served, each with an icon and a one-liner; hover reveal.                                                                                                                                                                     |
| 5 | <b>Featured work</b>     | 3-4 best projects as large animated cards with image, title, industry; hover = scale/parallax; link to case study.                                                                                                                                  |
| 6 | <b>Why us / stats</b>    | Animated counters (projects delivered, industries, years, satisfaction) + 3-4 differentiators.                                                                                                                                                      |
| 7 | <b>Process</b>           | 4-step process (Discover → Design → Build → Launch) with connected, scroll-revealed steps.                                                                                                                                                          |
| 8 | <b>Testimonial</b>       | A standout quote (sample, clearly sample) with avatar and company.                                                                                                                                                                                  |
| 9 | <b>CTA band</b>          | Bold closing call-to-action leading to /contact.                                                                                                                                                                                                    |

## 6 Functional Requirements

P0 = must have · P1 = should have · P2 = bonus.

| ID        | Requirement                                                                                                   | Priority |
|-----------|---------------------------------------------------------------------------------------------------------------|----------|
| UI - 1    | All required pages/sections built, responsive 360px → desktop, no horizontal scroll.                          | P0       |
| UI - 2    | A consistent design system: tokens for colour, typography scale, spacing, radius, shadows; reused everywhere. | P0       |
| UI - 3    | Signature hero with high-quality motion; clear visual hierarchy across the site.                              | P0       |
| MOT - 1   | Scroll-reveal animations, hover states and page/section transitions (Framer Motion / GSAP).                   | P0       |
| MOT - 2   | Micro-interactions: buttons, links, cards, nav; custom cursor / magnetic buttons (optional).                  | P1       |
| WORK - 1  | Portfolio with industry filter and animated grid; case-study detail pages.                                    | P0       |
| FORM - 1  | Contact form with client + server validation, stored in DB, success/error feedback.                           | P0       |
| FORM - 2  | Email notification to the studio on new enquiry (Nodemailer/Resend); optional auto-reply.                     | P1       |
| CMS - 1   | Admin login + dashboard to create/edit/delete projects and view enquiries (so content isn't hard-coded).      | P1       |
| SEO - 1   | Per-page meta titles/descriptions, Open Graph tags, favicon, sitemap, semantic HTML.                          | P1       |
| A11Y - 1  | Keyboard navigable, visible focus, alt text, colour contrast ≥ 4.5:1, respects prefers-reduced-motion.        | P1       |
| PERF - 1  | Optimised images (next/image or compressed), lazy loading, Lighthouse ≥ 85 desktop.                           | P1       |
| THEME - 1 | Dark/light toggle (the brand is dark-first; a tasteful light mode is a bonus).                                | P2       |

| ID      | Requirement                                                               | Priority |
|---------|---------------------------------------------------------------------------|----------|
| EXTRA-1 | Blog/insights section, newsletter (store emails), live chat widget, i18n. | P2       |

## 7 User Flows

### Prospective client

### Admin (CMS, P1)

## 8 API Specification

The backend is lightweight — most of the site is presentational. Required endpoints center on the contact form and the optional projects CMS.

### API conventions (apply to every endpoint)

- Base URL: `/api/v1`. All request/response bodies are JSON unless uploading files (`multipart/form-data`).
- Auth header: `Authorization: Bearer <accessToken>` (or an `httpOnly` cookie — pick one and be consistent).
- Success shape: `{ success: true, data: ..., message?: string }`.
- Error shape: `{ success: false, error: { code: 'VALIDATION_ERROR', message: '...', details?: [...] } }`.
- Status codes: 200 OK, 201 Created, 400 Validation, 401 Unauthenticated, 403 Forbidden (wrong role), 404 Not found, 409 Conflict, 429 Too many requests, 500 Server error.
- List endpoints support `?page=1&limit=20&sort=-createdAt&search=...` and return `{ items, page, limit, total, totalPages }`.

| Method | Endpoint        | Access                | Purpose                                                                                        |
|--------|-----------------|-----------------------|------------------------------------------------------------------------------------------------|
| POST   | /contact        | Public (rate-limited) | Create enquiry: name, email, company, budget, service, message. Validate, store, email studio. |
| GET    | /projects       | Public                | List projects; query by industry, featured; pagination                                         |
| GET    | /projects/:slug | Public                | One case study                                                                                 |
| POST   | /auth/login     | Admin                 | Admin login (seeded admin)                                                                     |
| POST   | /projects       | Admin                 | Create project (multipart / Cloudinary URLs)                                                   |
| PATCH  | /projects/:id   | Admin                 | Update / publish / feature                                                                     |
| DELETE | /projects/:id   | Admin                 | Delete project                                                                                 |
| GET    | /enquiries      | Admin                 | List enquiries (filter by status, date)                                                        |
| PATCH  | /enquiries/:id  | Admin                 | Mark read / replied / archived                                                                 |
| POST   | /newsletter     | Public                | Store email (P2)                                                                               |

## Sample: POST /api/v1/contact

```
contact endpoint

// Request
{ "name": "Rahul Mehta", "email": "rahul@cafedelight.in", "company": "Cafe Delight",
  "budget": "50k-1L", "service": "Website + Ordering", "message": "Need a site for our new cafe." }

// 201 Created
{ "success": true, "message": "Thanks! We'll get back within 24 hours.",
  "data": { "id": "6702ff..." } }

// 400 Validation
{ "success": false, "error": { "code": "VALIDATION_ERROR",
  "message": "A valid email is required", "details": [{ "path": "email" }] } }
```

## 9 Database Design (MongoDB)

### projects

| Field                              | Type              | Notes                                                                |
|------------------------------------|-------------------|----------------------------------------------------------------------|
| title, slug                        | String            | slug unique, indexed                                                 |
| industry                           | enum              | REAL_ESTATE   CAFE   CLOTHING   HEALTHCARE   CRM   ECOMMERCE   OTHER |
| summary, problem, solution, result | String            | case-study content                                                   |
| coverImage, gallery[]              | [{url, publicId}] | Cloudinary                                                           |
| techStack[]                        | [String]          | e.g. React, Node, Stripe                                             |
| liveUrl, clientName, year          | String / Number   | clientName optional                                                  |

| Field                 | Type    | Notes                   |
|-----------------------|---------|-------------------------|
| featured, isPublished | Boolean | home page uses featured |
| order                 | Number  | manual sort             |

## enquiries & others

| Collection    | Key fields                                                                                          |
|---------------|-----------------------------------------------------------------------------------------------------|
| enquiries     | name, email, company, budget, service, message, status (NEW   READ   REPLIED   ARCHIVED), createdAt |
| users (admin) | name, email (unique), passwordHash, role: ADMIN                                                     |
| newsletter    | email (unique), createdAt (P2)                                                                      |

## 10 UI / UX & Design System

This is the heart of the PS. Build a real, documented design system and apply it with discipline — consistency is what separates a premium site from a template.

### Suggested palette (“angaari” — refine your own)

|                                                                                     |                                                                         |                                                                                     |                                                             |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------|
|  | <b>Base — Charcoal Black</b><br>#0C0A09<br>Page background (dark-first) |  | <b>Surface</b><br>#1A1614<br>Cards, sections                |
|  | <b>Ember — Primary</b><br>#F2660A<br>Primary accent, CTAs, highlights   |  | <b>Flame</b><br>#FF8A1E<br>Secondary accent, gradients      |
|  | <b>Gold Spark</b><br>#FACC15<br>Micro-accents, hover glow               |  | <b>Ash</b><br>#A8A29E<br>Secondary text                     |
|  | <b>Smoke White</b><br>#F5F5F4<br>Primary text on dark                   |  | <b>Ember Glow</b><br>#7C2D12<br>Deep shadow / gradient stop |

### Typography

- Display / headings: a strong characterful face — Clash Display, Anton, Satoshi, Space Grotesk, or Druk-style. Use large sizes, tight tracking.
- Body: a clean grotesk — Inter, Satoshi, General Sans.
- Establish a type scale (e.g. 12 / 14 / 16 / 20 / 28 / 40 / 64 / 96) and stick to it.
- Use 1–2 fonts total; let size and weight create hierarchy, not many fonts.

## Design tokens & rules

| Token group    | Guideline                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------|
| Spacing        | 8-pt scale (4, 8, 12, 16, 24, 32, 48, 64, 96, 128). Generous section padding (py-24+ on desktop).                    |
| Radius         | Consistent (e.g. 8 / 16 / 24px). Pick a vibe and keep it.                                                            |
| Shadows / glow | Use warm glows (ember) rather than flat grey shadows to match the brand.                                             |
| Buttons        | One primary (ember fill), one secondary (outline/ghost), one text link — each with a clear hover/active/focus state. |
| Imagery        | High-quality visuals; use warm overlays/duotone to unify stock imagery with the brand.                               |
| Grid           | 12-column responsive grid; max content width ~1200–1280px; consistent gutters.                                       |
| Icons          | One icon set (Lucide / Phosphor). Don't mix sets.                                                                    |

## Motion guidelines

- Framer Motion for component motion; GSAP + ScrollTrigger for scroll timelines; Lenis for smooth scroll.
- Signature-worthy hero: split-text reveal (Splitting.js / manual), animated gradient or canvas embers, parallax.
- Scroll reveals with `whileInView` + stagger; keep them subtle and consistent (one reveal language site-wide).
- Hover: cards lift/scale, images parallax, buttons glow; magnetic buttons & custom cursor are nice bonuses.
- Animate only `transform/opacity`; durations 0.4–1.0 s; respect `prefers-reduced-motion`.

## Design principles

- **Hierarchy** — one clear focal point per section; guide the eye with size, colour and space.
- **Consistency** — same button, same card, same spacing rhythm everywhere.
- **Whitespace** — let the design breathe; cramped = cheap.
- **Contrast & legibility** — ember on charcoal must still pass contrast for text; never sacrifice readability for style.
- **Purposeful motion** — animation should guide attention, not distract; every section shouldn't scream.

# Tech Stack & Libraries

| Layer    | Recommended                                                                                                                                                                                                                        |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Frontend | <b>Next.js (App Router)</b> preferred (SEO, next/image, routing) or React + Vite. Tailwind CSS, shadcn/ui, Framer Motion, GSAP + ScrollTrigger, Lenis, Lucide/Phosphor icons, Splitting.js / react-type-animation, embla-carousel. |
| Backend  | Node.js + Express (or Next Route Handlers) — Mongoose, zod, bcrypt, jsonwebtoken, multer + Cloudinary, nodemailer/Resend, express-rate-limit, helmet.                                                                              |
| Database | MongoDB Atlas                                                                                                                                                                                                                      |
| Media    | Cloudinary / next/image optimisation                                                                                                                                                                                               |
| Deploy   | Vercel / Netlify (frontend), Render / Railway (API), Atlas (DB)                                                                                                                                                                    |

## 12 Suggested Folder Structure

repository layout

```

angaar-labs/
├── app/ (or src/)
│   ├── page.tsx                home
│   ├── about/ story/ services/ contact/
│   ├── work/ page.tsx  work/[slug]/page.tsx
│   └── admin/                login + CMS (P1)
├── components/
│   ├── sections/  Hero, Services, Industries, FeaturedWork, Stats, Process, CTA
│   ├── ui/        Button, SectionHeading, Card, Marquee, Reveal, Counter
│   └── layout/     Navbar, Footer, MobileMenu, PageTransition
├── lib/            api.ts, motion presets, cn()
├── styles/         tokens (tailwind.config), globals.css
├── content/        projects seed / fallback data
├── server/ (if separate)  models/ routes/ controllers/ middlewares/
└── .env.example
  
```

## 13 Team Division & Milestones

| Role in team         | Owns                                                           |
|----------------------|----------------------------------------------------------------|
| Design/motion lead   | Design system, hero, home sections, all animations             |
| Frontend #2          | About, Story, Services, Work grid + case study, responsiveness |
| Backend / full-stack | Contact API + email, projects CMS, admin auth, deployment      |
| Everyone             | Content, image optimisation, accessibility pass, README, video |

| Phase            | Share of time | Done when...                                                                            |
|------------------|---------------|-----------------------------------------------------------------------------------------|
| 0. Design        | ~15%          | Design system + hero concept agreed (even a quick Figma/sketch), fonts & palette locked |
| 1. Build system  | ~15%          | Tokens, Button/Card/Section components, Navbar, Footer, layout deployed                 |
| 2. Home          | ~25%          | All home sections built & animated, responsive                                          |
| 3. Inner pages   | ~25%          | About, Story, Services, Work + case study                                               |
| 4. Backend       | ~10%          | Contact form works end-to-end + email; CMS if time                                      |
| 5. Polish & ship | ~10%          | A11y, performance, SEO, deploy, README, video                                           |

## 14 Vibe Coding Playbook

### How to vibe-code this well (general)

- 1 **Plan before you prompt.** Spend the first slice of time agreeing on the data models, the API list and the page list (this document already gives you most of it). Paste them into a `SPEC.md` in the repo so every AI session can read it.
- 2 **Scaffold first, features second.** Get an empty frontend talking to an empty backend talking to MongoDB, deployed, before building features.
- 3 **One feature per prompt.** Ask for the schema, then the route, then the UI. Giant “build the whole app” prompts produce code that breaks in ten places.
- 4 **Give the AI context.** Attach the relevant files and the spec. Tell it your stack, folder structure and conventions explicitly.
- 5 **Review every diff.** Read what the AI wrote. Run it. Test the unhappy paths (wrong password, empty form, unauthorised role).
- 6 **Commit after every working step** so you can roll back when a prompt breaks something.

### Starter prompts

PROMPTS.md (examples)

PROMPT – Design tokens

"Set up a Tailwind config for a dark-first, fiery 'ember' brand: charcoal base #0C0A09, surface #1A1614, primary ember #F2660A, flame #FF8A1E, gold #FACC15. Add a type scale, warm glow shadows, and container widths. Generate a Button component with primary/secondary/ghost variants and hover glow."

PROMPT – Hero

"Build a full-viewport hero for a web studio called The Angaar Labs. Dark charcoal background with an animated ember-gradient + subtle particle embers (canvas or tsParticles). Headline reveals word-by-word with Framer Motion, two CTAs, a scroll hint. 60fps, transform/opacity only, reduced-motion fallback."

PROMPT – Work grid

"Create a filterable portfolio grid (industries: Real Estate, Cafe, Clothing, Healthcare, CRM, E-commerce). Cards animate in on scroll (stagger), lift and parallax the image on hover, and link to /work/[slug]. Data comes from an API."

## 15 Submission Format

Submit the following through the form / channel announced by your instructor before the deadline. Late or incomplete submissions are penalised.

| # | Deliverable       | Details                                                                                                                                 |
|---|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 1 | GitHub repository | Public (or shared with the evaluator). Default branch must contain the final code. Every team member must appear in the commit history. |
| 2 | README.md         | Use the template below. Must include setup steps that work on a fresh machine.                                                          |
| 3 | .env.example      | Every variable your app reads, with a one-line comment explaining it. <b>No real secrets.</b>                                           |

| # | Deliverable                   | Details                                                                                                                                |
|---|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| 4 | Live deployment               | Frontend + backend URLs (Vercel / Netlify / Render / Railway). If deployment is not possible, a flawless local setup is mandatory.     |
| 5 | Demo video (3–5 min)          | Screen recording with voice-over covering every P0 feature end-to-end. Upload to Google Drive / YouTube (unlisted) and share the link. |
| 6 | Test credentials              | One account per role, listed in the README (e.g. <code>admin@demo.com</code> / <code>Admin@123</code> ).                               |
| 7 | PROMPTS.md                    | The 10–20 most important prompts your team used, in order, with a one-line note on what each produced.                                 |
| 8 | Live link (strongly required) | A UI-first site must be seen live. Deploy the frontend; backend on Render/Railway.                                                     |
| 9 | Design note                   | A short paragraph (in README) on your design direction: fonts, palette, motion language, and why.                                      |

## README.md template

README.md

```
# <Project Name> – PS 0X | Team <Team Name>

## Team
| Name | Roll No. | GitHub | Primary responsibility |
|-----|-----|-----|-----|

## Live Links
- Frontend: https://...
- Backend : https://...
- Demo video: https://...

## Tech Stack
React/Next.js, Node.js, Express, MongoDB, ... (list every major library)

## Features
- [x] P0 feature 1
- [x] P0 feature 2
- [ ] P2 bonus feature (not done)

## Architecture
Short paragraph + diagram/screenshot of how the pieces talk to each other.

## Local Setup
1. git clone ... && cd ...
2. cd server && npm install && cp .env.example .env # fill values
3. npm run seed && npm run dev
4. cd ../client && npm install && npm run dev

## Test Credentials
admin@demo.com / Admin@123 (role: admin)

## API Documentation
Link to Postman collection / Swagger, or a table of endpoints.

## Known Limitations
Be honest. What does not work yet?
```

## 16 Evaluation Rubric (100 marks)

| Criterion                    | What evaluators check                                                              | Marks |
|------------------------------|------------------------------------------------------------------------------------|-------|
| Visual design                | Originality, hierarchy, typography, colour, spacing, imagery, overall premium feel | 28    |
| Motion & interaction         | Hero impact, scroll reveals, hover states, transitions, 60 fps, cohesion           | 22    |
| Completeness                 | All required pages/sections with real content and case studies                     | 12    |
| Responsiveness               | Flawless mobile → desktop, mobile menu, no overflow                                | 10    |
| Contact & backend            | Working validated form, storage, email; CMS (P1)                                   | 10    |
| Code quality & design system | Reusable components, tokens, structure, no copy-paste chaos                        | 8     |
| Performance, SEO & a11y      | Image optimisation, Lighthouse, meta/OG, keyboard & contrast                       | 5     |
| Viva & PROMPTS.md            | Each member explains their part; design decisions                                  | 5     |
| Bonus (max +10)              | Light/dark toggle, custom cursor, 3D (R3F), blog, i18n, truly standout hero        | +10   |

## 17 Hints

### TIP · Hint 1 — Steal structure, not pixels

Study 5–10 award-winning agency sites (Awwwards, Godly). Note their section order, spacing rhythm and motion — then execute your own ember-themed version. Don't clone one site.

### TIP · Hint 2 — The hero decides your grade

Spend disproportionate time on the hero and one signature scroll moment. A stunning hero + consistent system beats ten mediocre animated sections.

### TIP · Hint 3 — Tokens first, pages second

Lock colours, type scale and the Button/Card/Section components before building pages. Everything after becomes fast and consistent.

### TIP · Hint 4 — Optimise images early

Big unoptimised hero images kill performance and make parallax stutter. Use next/image or compressed WebP from day one.

## 18 Common Mistakes to Avoid

- A default Bootstrap/template look — this PS rewards originality.
- Inconsistent spacing and five different button styles.
- Over-animating — every element flying in from everywhere; no focal point.
- Ignoring mobile until the end — design mobile-first.
- Low contrast ember-on-charcoal text that's unreadable.
- Hard-coding all projects with no backend/CMS when CMS was feasible (costs P1 marks).
- A contact form that doesn't actually store or notify anything.

## 19 FAQ & Extra Information

| Question                                 | Answer                                                                                                  |
|------------------------------------------|---------------------------------------------------------------------------------------------------------|
| Do we have to use the real logo?         | Yes — the provided Angaar Labs logo must be used in the navbar/footer and favicon.                      |
| Where do we get studio content?          | Search “The Angaar Labs” online for real info; clearly label any sample testimonials/clients as sample. |
| Is the CMS mandatory?                    | It's P1. A great site with hard-coded projects can still score well, but a CMS lifts you higher.        |
| React or Next.js?                        | Either; Next.js is recommended for SEO and image optimisation on a marketing site.                      |
| Can we use a UI kit (shadcn/Aceternity)? | Yes, but theme it to the brand and don't ship the default demo look.                                    |
| Light or dark theme?                     | Dark-first (brand). A tasteful light mode is a bonus.                                                   |
